

Lawn & Garden Soil Test Instructions

Sample Collecting Procedures

- Collect two cups of soil preferably 6 inches deep (taking just surface soil will cause the readings to be higher and taking soil deeper than 6 inches will cause lower readings)
- You may collect samples from different areas for the same sample as long as the areas seem similar and are free of noticeable problems. If you have areas of concern, it is best to keep the soil separate and run an individual test. **We advise that you send control sample(s) if you are have problems areas so we can compare the area to the samples that are producing correctly to the problem areas.**
- The samples can be put in any clean container or a plastic bag. Label the sample for your information (ex. Backyard lawn, or garden).
